Applicant(s)

ELDRIDGE ET AL.

Examiner

Tu-Tu Ho

Art Unit

2818

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 10 May 2005.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-71 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-3, 5-16 and 18-71 is/are rejected.
- 7) ☒ Claim(s) 4 and 17 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 18 February 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after allowance or after an Office action under *Ex Parte Quayle*, 25 USPQ 74, 453 O.G. 213 (Comm'r Pat. 1935). Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, prosecution in this application has been reopened pursuant to 37 CFR 1.114.

Applicant's submission filed on 05/10/2005 has been entered.

2. The indicated allowability of claims 1-3, 5-16, and 18-71 is withdrawn in view of the newly discovered reference(s) to Endo U.S. Patent 5,619,051. Rejections based on the newly cited reference(s) follow.

Claim Rejections - 35 USC § 102

3. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

4. **Claim 1, 2, 11, 15, 48, and 69-70** are rejected under 35 U.S.C. 102(b) as anticipated by Endo U.S. Patent 5,619,051 (the '051 reference).

Referring to **claim 1**, the reference discloses a floating gate transistor, comprising:

a first source/drain region (22 or 24, Fig. 5) and a second source/drain region (24 or 22);

Art Unit: 2818

a channel region (no number) located between the first and second source/drain region;
a floating gate (16) operably positioned proximate to and separated from the channel region;
a control gate (20) operably positioned proximate to and separated from the floating gate;
and
an intergate insulator (18a) positioned between the floating gate and the control gate, the intergate insulator having a thickness and including a mixture of component oxides ($\text{Ba}(\text{Sr})\text{TiO}_3$, column 7, lines 1-12) having varied concentrations to provide a composition gradient across the thickness (“a gradient of chemical composition in the thickness direction”, paragraph bridging columns 6 and 7) and provide different barrier heights with respect to the floating gate and the control gate (column 7, last paragraph), the component oxides including at least one metal oxide ($\text{Ba}(\text{Sr})\text{TiO}_3$).

Referring to **claims 11 and 2** and using the reference characters, citations, and interpretations as detailed above for claim 1 where applicable, the ‘051 reference discloses a device, comprising:

a first source/drain region and a second source/drain region;
a channel region located between the first and second source/drain region;
a polysilicon floating gate (column 3, lines 56-63) operably positioned proximate to and separated from the channel region by an oxide (14);
a control gate operably positioned proximate to and separated from the floating gate; and
an intergate insulator positioned between the floating gate and the control gate, the intergate insulator having a thickness and including a mixture of component metal oxides having

Art Unit: 2818

varied concentrations to provide a composition gradient across the thickness and provide different barrier heights with respect to the floating gate and the control gate.

Referring to **claim 15** and using the reference characters, citations, and interpretations as detailed above for claims 1-2 where applicable, the '051 reference discloses a device, comprising:

- a first source/drain region and a second source/drain region;
- a channel region located between the first and second source/drain region;
- a polysilicon floating gate operably positioned proximate to and separated from the channel region by an oxide;
- a control gate operably positioned proximate to and separated from the floating gate; and
- an intergate insulator positioned between the floating gate and the control gate, the intergate insulator having a thickness and including transition metal oxides ((Ba(Sr)TiO₃) having varied concentrations to provide a composition gradient across the thickness and provide asymmetrical tunnel barriers with the floating gate and the control gate (asymmetrical tunnel barrier intergate insulator 18A, wherein "the dielectric film 18A is formed of a solid solution of two kinds of metal oxides, and the proportions of two metal oxides vary continuously of stepwise from the bottom plane adjacent to the floating gate 16 to the top plane", column 7, lines 1-8, emphasis added by the examiner, and where the "tunnel barrier" property is interpreted to be inherent as the stepwise-graded dielectric layer 18A is a barrier to, for example, electrons tunneling from, for example, from the floating gate to, for example, the control gate; and the characteristic "vary continuously of stepwise from the bottom plane adjacent to the floating gate 16 to the top plane" of the solid solution of the two kinds of metal oxides of the intergate

Art Unit: 2818

insulator 18A is executed such that there is a difference in tunnel barrier (different band gap widths) at an interface with the floating gate and the control gate – hence, asymmetrical – paragraph bridging columns 7 and 8).

Referring to **claim 48** and using the reference characters, citations, and interpretations as detailed above for claims 1-2 and 15 where applicable, the '051 reference discloses a horizontally-oriented device, comprising:

- a substrate (10);

- a first source/drain region and a second source/drain region located in the substrate, and a channel region located between the first and second source/drain regions;

- a floating gate operably positioned over and separated from the channel region;

- a control gate operably positioned over and separated from the floating gate; and

- an intergate insulator positioned between the floating gate and the control gate, the intergate insulator having a thickness and including a mixture of component oxides having varied concentrations to provide a composition gradient and provide different barrier heights at an interface with the floating gate and at an interface with the control gate, the component oxides including at least one metal oxide.

Referring to **claims 69 and 70**, the '051 reference discloses a device as claimed and as detailed above for claims 1-2 and 15, but fails to teach the exact method as claimed. However, the limitation is a product-by-process limitation and considered a non-limitation in a device claim.

Claim Rejections - 35 USC § 103

Art Unit: 2818

5. **Claims 3,5-10,12-14,16,18-41,49-68 and 71** are rejected under 35 U.S.C. §103(a) as being unpatentable over Endo U.S. Patent 5,619,051 (the '051 reference).

Referring to **claims 22 and 54**, the '051 reference discloses a device as claimed and as detailed above for claims 1-2 and 15, but fails to teach the exact material as claimed.

Specifically, the reference discloses a high-dielectric, asymmetrical-tunnel-barrier intergate insulator's material including Ba(Sr)TiO₃, an oxide of a transition metal, rather than TiO₂ and ZrO₂, an oxide of a transition metal and an oxide of another transition metal, as claimed.

However, they are all oxide of a transition metal constituting the high-dielectric, asymmetrical-tunnel-barrier intergate insulator, therefore the change from one material to another material would have been obvious to one of ordinary skill in the art. Referring to the process of claim 54, the limitation is a product-by-process limitation and considered a non-limitation in a device claim.

Referring to **claims 26 and 57**, the '051 reference discloses a device as claimed and as detailed above for claims 1-2 and 15, but fails to teach the exact material as claimed.

Specifically, the reference discloses a high-dielectric, asymmetrical-tunnel-barrier intergate insulator's material including Ba(Sr)TiO₃, an oxide of a transition metal, rather than TiO₂ and HfO₂, an oxide of a transition metal and an oxide of another transition metal, as claimed.

However, they are all oxide of a transition metal constituting the high-dielectric, asymmetrical-tunnel-barrier intergate insulator, therefore the change from one material to another material would have been obvious to one of ordinary skill in the art. Referring to the process of claim 57, the limitation is a product-by-process limitation and considered a non-limitation in a device claim.

Referring to **claims 30 and 60**, the '051 reference discloses a device as claimed and as detailed above for claims 1-2 and 15, but fails to teach the exact material as claimed.

Specifically, the reference discloses a high-dielectric, asymmetrical-tunnel-barrier intergate insulator's material including Ba(Sr)TiO₃, an oxide of a transition metal, rather than ZrO₂ and HfO₂, an oxide of a transition metal and an oxide of another transition metal, as claimed.

However, they are all oxide of a transition metal constituting the high-dielectric, asymmetrical-tunnel-barrier intergate insulator, therefore the change from one material to another material would have been obvious to one of ordinary skill in the art. Referring to the process of claim 60, the limitation is a product-by-process limitation and considered a non-limitation in a device claim.

Referring to **claims 34 and 63**, the '051 reference discloses a device as claimed and as detailed above for claims 1-2 and 15, but fails to teach the exact material as claimed.

Specifically, the reference discloses a high-dielectric, asymmetrical-tunnel-barrier intergate insulator's material including Ba(Sr)TiO₃, an oxide of a transition metal, rather than TiO₂, ZrO₂ and HfO₂, an oxide of a transition metal, an oxide of another transition metal, and an oxide of another transition metal, as claimed. However, they are all oxide of a transition metal constituting the high-dielectric, asymmetrical-tunnel-barrier intergate insulator, therefore the change from one material to another material would have been obvious to one of ordinary skill in the art. Referring to the process of claim 63, the limitation is a product-by-process limitation and considered a non-limitation in a device claim.

Referring to **claims 38 and 66** and using the reference characters, citations, and interpretations as detailed above for claims 1-2 and 15 where applicable, the '051 reference discloses a device, comprising:

- a first source/drain region and a second source/drain region;
- a channel region located between the first and second source/drain region;
- a polysilicon floating gate operably positioned proximate to and separated from the channel region by an oxide;
- a control gate operably positioned proximate to and separated from the floating gate; and
- an intergate insulator positioned between the floating gate and the control gate, the intergate insulator having a thickness and including $\text{Ba}(\text{Sr})\text{TiO}_3$ to provide a graded mixed oxide insulator, $\text{Ba}(\text{Sr})\text{TiO}_3$ having varied concentrations across the thickness to provide a composition gradient across the thickness and provide asymmetrical tunnel barriers with the floating gate and the control gate.

However, it is clear that the reference does not teach an exact material for the claimed high-dielectric, asymmetrical-tunnel-barrier intergate insulator. Nevertheless, the ability to chose and prepare a material from the known and available materials to form an intended-use product, a high-dielectric, asymmetrical-tunnel-barrier intergate insulator in the instant case, is generally within the ability of a person of ordinary skill in the art therefore would have been obvious.

Referring to the process of claim 66, the limitation is a product-by-process limitation and considered a non-limitation in a device claim. Referring to the limitation layers of Al_2O_3 and layers of SiO_2 , although the claimed atomic layer deposition in theory and practice is depositing

Art Unit: 2818

one atomic layer at a time upon the previous one atomic layer– and thus one could call layers of – but the final product is a one comprehensible tangible single layer of a high-dielectric, asymmetrical-tunnel-barrier intergate insulator.

Referring to the limitation “wherein a region proximate to the floating gate includes more Al_2O_3 layers and fewer SiO_2 layers than a region proximate to the control gate” of claim 66, which appears to be for the purpose of providing a region proximate to the floating gate with a region of a lower work function than a region proximate to the control gate, the reference teaches that a region proximate to the floating gate includes more barium titanate and fewer strontium titanate than a region proximate to the control gate, which appears to be also for the purpose of providing a region proximate to the floating gate with a region of a lower work function than a region proximate to the control gate. Hence, again, the difference between the disclosed and the claimed is a choice of the known and available materials tailored for the same purpose, and the ability to chose and prepare a material from the known and available materials to form an intended-use product, a high-dielectric, asymmetrical-tunnel-barrier intergate insulator in the instant case, is generally within the ability of a person of ordinary skill in the art therefore would have been obvious.

Referring to **claims 3, 5-10, 12-14, 16, 18-21, 23-25, 27-29, 31-33, 35-37, 39-41, 55-56, 58-59, 61-62, 64-65, 67-68, and 71**, the ‘051 patent discloses a non volatile memory cell substantially as claimed and as detailed above for claims 1-2 and 15 and other independent claims including the high-dielectric asymmetrical tunnel barrier intergate insulator 18A including a number of small compositional ranges arranged in a “vary continuously of stepwise” from the bottom surface to the top surface. The reference further discloses, in reference to **claim 18**, that

the number of small compositional ranges is formed such that gradients can be formed in an applied electric field which produce different barrier heights at an interface with the floating gate and control gate (paragraph bridging columns 7 and 8, particularly "...gradient of conduction band to make an about 0.4 eV difference...information charge retention time is about twice that in the memory cell of FIG. 1...the erase time shortens to 1/5 of that in the memory cell having the dielectric film 18 of homogeneous barium strontium titanate).

The reference further teaches that the floating gate includes a polysilicon floating gate having a metal silicide formed thereon (column 3, lines 56-63) in contact with the asymmetrical low tunnel barrier intergate insulator, and that the control gate includes a metal control gate having a metal oxide layer formed thereon in contact with the asymmetrical low tunnel barrier intergate insulator.

Compared with the claims, the reference discloses a metal silicide instead of the claimed first metal layer for the floating gate, a metal oxide/metal instead of the claimed second metal/polysilicon for the control gate. However, the differences are deemed to be obvious to one of ordinary skill in the art at the time the invention was made because at least one of the following two reasons: (1) the materials are known and available to the artisan and are provided for the same purpose; (2) both the present invention and the reference fails to show an advantage of one combination of materials to the other, except for the same purpose of providing a high-dielectric, asymmetrical-tunnel-barrier intergate insulator.

With respect to the limitation "wherein the metal layer includes a metal layer that has a different work function than the metal layer formed on the floating gate", the limitation appears to be inherent in the reference because: (1) the metal of the metal silicide (functionally

Art Unit: 2818

equivalent to the claimed first metal) and the metal of the metal oxide (functionally equivalent to the claimed second metal) are different metals, resulting in different work functions; (2) the paragraph bridging columns 7 and 8, as noted above, expressly states that the barrier heights at the two surfaces of the asymmetrical low tunnel barrier intergate insulator, where the metal silicide and the metal oxide are respectively in contact with, ought to be different, leading the artisan to conclude that the work function of the metal silicide (functionally equivalent to the claimed first metal) should be different from the work function of the metal oxide (functionally equivalent to the claimed second metal).

Referring to **claims 49-53**, as detailed above for claims 22, 26, 30, 34, 38, and 42, the ability to chose and prepare a material from the known and available materials to form an intended-use product, a high-dielectric, asymmetrical-tunnel-barrier intergate insulator in the instant case, is generally within the ability of a person of ordinary skill in the art therefore would have been obvious.

6. **Claims 42-47** are rejected under 35 U.S.C. 103(a) as being unpatentable over Endo U.S. Patent 5,619,051 (the '051 patent) in view of Orłowski et al. U.S. Patent 6,433,382.

Referring to **claim 42**, the '051 patent discloses a non volatile memory cell substantially as claimed and as detailed above for the other independent claims, and including the high-dielectric, asymmetrical-tunnel-barrier intergate insulator 18A and a first source/drain region (22 or 24) and a second source/drain region (24 or 22) separated by a channel region (no number) in a substrate. However, the reference fails to disclose a body region including the channel region and that the body region including the channel region is formed on the first source/drain region.

Art Unit: 2818

In other words, the reference discloses a “planar” non volatile memory cell instead of a vertical non volatile memory cell as claimed.

Orlowski, in disclosing also a non volatile memory cell including a pair of source/drain regions, a channel region, a floating gate, and a control gate, teaches that vertical non volatile memory cell offers many advantages over a planar non volatile memory cell such as space saving, improved performance, and reduced masking steps (column 14, first paragraph). Therefore, it would have been obvious to one of ordinary skill in the art the time the invention was made to form the reference’s non volatile memory cell such that it has a vertical configuration. One would have been motivated to make such a change because a vertical non volatile memory cell offers many advantages over a planar non volatile memory cell such as space saving, improved performance, and reduced masking steps, as taught by Orlowski.

Referring to **claims 43-47**, as detailed above for claims 22, 26, 30, 34, 38, and 42, the ability to chose and prepare a material from the known and available materials to form an intended-use product, a high-dielectric, asymmetrical-tunnel-barrier intergate insulator in the instant case, is generally within the ability of a person of ordinary skill in the art therefore would have been obvious.

Allowable Subject Matter

7. Claims 4 and 17 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is an examiner's statement of reasons for the indication of allowable subject matter: The cited art, whether taken singularly or in combination, especially when all limitations are considered within the claimed specific combination, fails to teach or render obvious a device having all exclusive limitations as recited in claims 1/3/4 (claims 1, 3, and 4) and claims 15/16/17, characterized in that the metal layer includes a metal corresponding to a metal of the metal oxide, the metal oxide constituting the component oxides that form the intergate insulator that provides a composition gradient across the thickness and provide different barrier heights with respect to the floating gate and the control gate.

Conclusion

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tu-Tu Ho whose telephone number is (571) 272-1778. The examiner can normally be reached on 6:30 am - 5:00 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, DAVID NELMS can be reached on (571) 272-1787. The fax phone numbers for the organization where this application or proceeding is assigned are (703) 872-9306 for regular communications and (703) 872-9306 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 308-1782.
